The optimal values are gives as:

$$> \alpha := 135$$

$$\alpha := 135 \quad (1)$$

$$> \alpha_p := 0$$

$$\alpha_p := 0 \quad (2)$$

$$> \beta := 157.5$$

$$\beta := 157.5 \quad (3)$$

$$> \beta_p := 22.5$$

$$\beta_p := 22.5 \quad (4)$$

Angles and corrsponding coincidences

$$> N(0, 22.5) := 1190$$

$$N(0, 22.5) := 1190 \quad (1.1)$$

$$> N(0, 67.5) := 245$$

$$N(0, 67.5) := 245 \quad (1.2)$$

$$> N(0, 112.5) := 137$$

$$N(0, 112.5) := 137 \quad (1.3)$$

$$> N(0, 157.5) := 1263$$

$$N(0, 157.5) := 1263 \quad (1.4)$$

$$> N(45, 22.5) := 429$$

$$N(45, 22.5) := 429 \quad (1.5)$$

$$> N(45, 67.5) := 132$$

$$N(45, 67.5) := 132 \quad (1.6)$$

$$> N(45, 112.5) := 706$$

$$N(45, 112.5) := 706 \quad (1.7)$$

$$> N(45, 157.5) := 1034$$

$$N(45, 157.5) := 1034 \quad (1.8)$$

$$> N(90, 22.5) := 114$$

$$N(90, 22.5) := 114 \quad (1.9)$$

$$> N(90, 67.5) := 364$$

$$N(90, 67.5) := 364 \quad (1.10)$$

$$> N(90, 112.5) := 398$$

$$N(90, 112.5) := 398 \quad (1.11)$$

$$\begin{aligned} & \text{> } N(90, 157.5) := 114 \\ & \qquad \qquad \qquad N(90, 157.5) := 114 \end{aligned} \tag{1.12}$$

$$\begin{aligned} & \text{> } N(135, 22.5) := 891 \\ & \qquad \qquad \qquad N(135, 22.5) := 891 \end{aligned} \tag{1.13}$$

$$\begin{aligned} & \text{> } N(135, 67.5) := 589 \\ & \qquad \qquad \qquad N(135, 67.5) := 589 \end{aligned} \tag{1.14}$$

$$\begin{aligned} & \text{> } N(135, 112.5) := 91 \\ & \qquad \qquad \qquad N(135, 112.5) := 91 \end{aligned} \tag{1.15}$$

$$\begin{aligned} & \text{> } N(135, 157.5) := 346 \\ & \qquad \qquad \qquad N(135, 157.5) := 346 \end{aligned} \tag{1.16}$$

The expectation value is given as following

$$E(a, b) = \frac{N(a, b) + N(a^\perp, b^\perp) - N(a^\perp, b) - N(a, b^\perp)}{N(a, b) + N(a^\perp, b^\perp) + N(a^\perp, b) + N(a, b^\perp)}$$

The expectation value is dependent on the correlation function $N(\alpha, \beta)$, and hereby the perpendicular values of a, b written as $a^\perp, b^\perp$. A function for the perpendicular value is therefor defined as

$$\begin{aligned} & \text{> } \text{perp}(v) := \begin{cases} v - 90 & v + 90 > 180 \\ v + 90 & v - 90 < 0 \end{cases} \\ & \qquad \qquad \qquad \text{perp} := v \mapsto \begin{cases} v - 90 & 0 < v - 90 \\ v + 90 & v < 90 \end{cases} \end{aligned} \tag{5}$$

$$\begin{aligned} & \text{> } E(a, b) := \frac{N(a, b) + N(\text{perp}(a), \text{perp}(b)) - N(\text{perp}(a), b) - N(a, \text{perp}(b))}{N(a, b) + N(\text{perp}(a), \text{perp}(b)) + N(\text{perp}(a), b) + N(a, \text{perp}(b))} \\ & \qquad \qquad \qquad E := (a, b) \mapsto \frac{N(a, b) + N(\text{perp}(a), \text{perp}(b)) - N(\text{perp}(a), b) - N(a, \text{perp}(b))}{N(a, b) + N(\text{perp}(a), \text{perp}(b)) + N(\text{perp}(a), b) + N(a, \text{perp}(b))} \end{aligned} \tag{6}$$

The given expectation values has to be defined for the gives S value

$$S = E(\alpha, \beta) - E(\alpha, \beta_p) + E(\alpha_p, \beta) + E(\alpha_p, \beta_p)$$

$$E(\alpha, \beta)$$

Expectation value for the given angles:

$$\begin{aligned} & \text{> } a := \alpha \\ & \qquad \qquad \qquad a := 135 \end{aligned} \tag{2.1}$$

$$\begin{aligned} & \text{> } b := \beta \\ & \qquad \qquad \qquad b := 157.5 \end{aligned} \tag{2.2}$$

$$\begin{aligned} & \text{> } E(a, b) \\ & \qquad \qquad \qquad \tag{2.3} \end{aligned}$$
